Course/Module: Mobile Application Development
App Name: Posts Manager

Handwritten Discussion

Flutter Lab 4.

Q1. Which dependencies did you use and why?

I used the http package to perform REST API requests GET, POST, PUT and DELETE

Also used dart:convert to convert JSON data from API into Dart objects used inside flutter application.

Q2 How can API exceptions be handled

API exceptions can be handled using try-catch blocks to detect network errors.

Also checking response.statusCode to verify if the server request was successful.

If an error occurs, application shows error message to the user.

Q3 Explain the FutureBuilder and which UI part depends on it

A future represents an asynchronous operation in flutter such as fetching data from API.

The UI uses FutureBuilder to wait for the API response

While waiting a loading spinner is shown.

Once data arrives, the listview displaying posts is rendered.

Application Screenshots

Figure 1: Main Screen – List of Posts retrieved from the API.

Figure 2: Create Post Form.

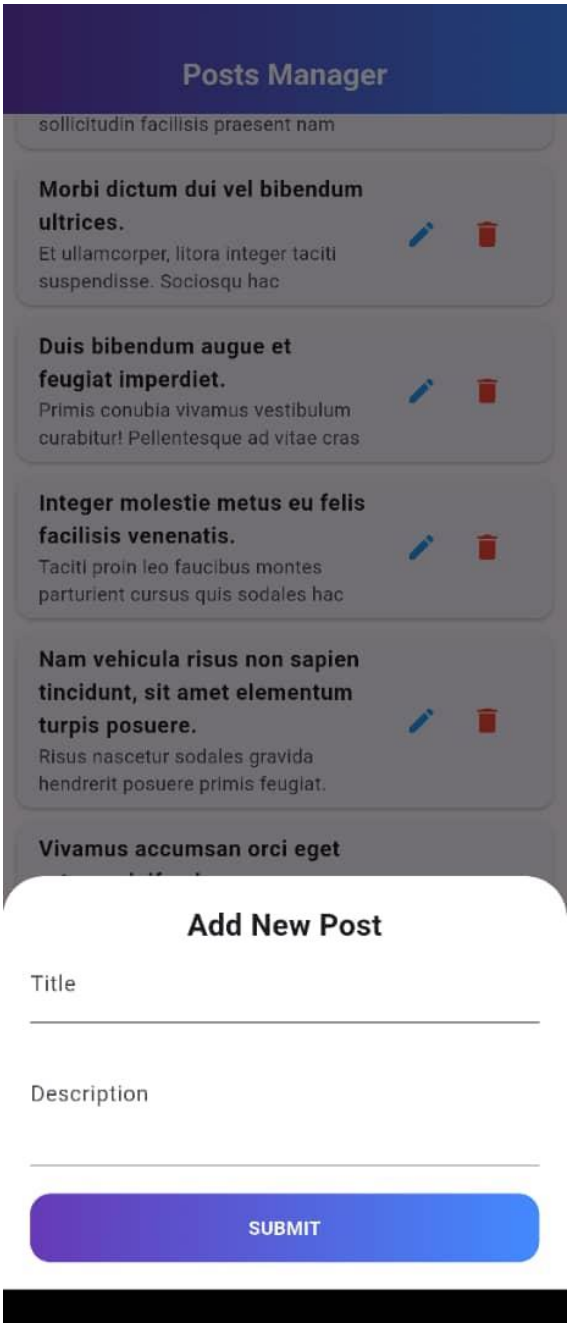

Figure 3: Edit Post Form.

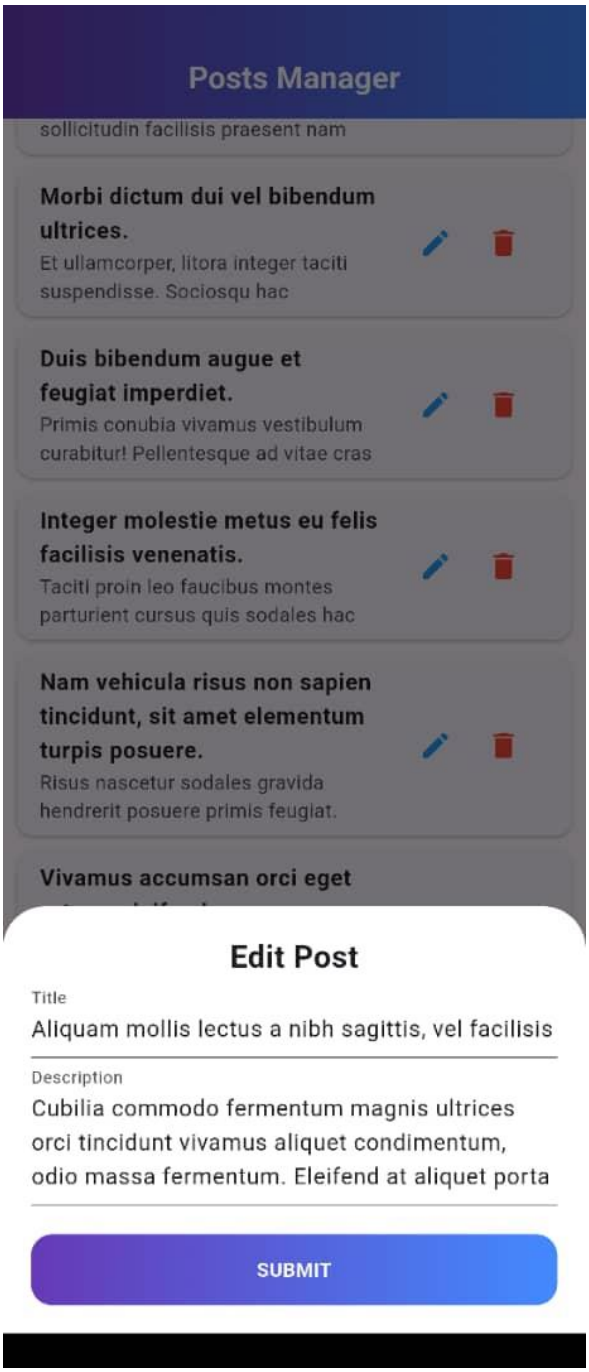

Figure 3: Post Detail Screen displaying full content.

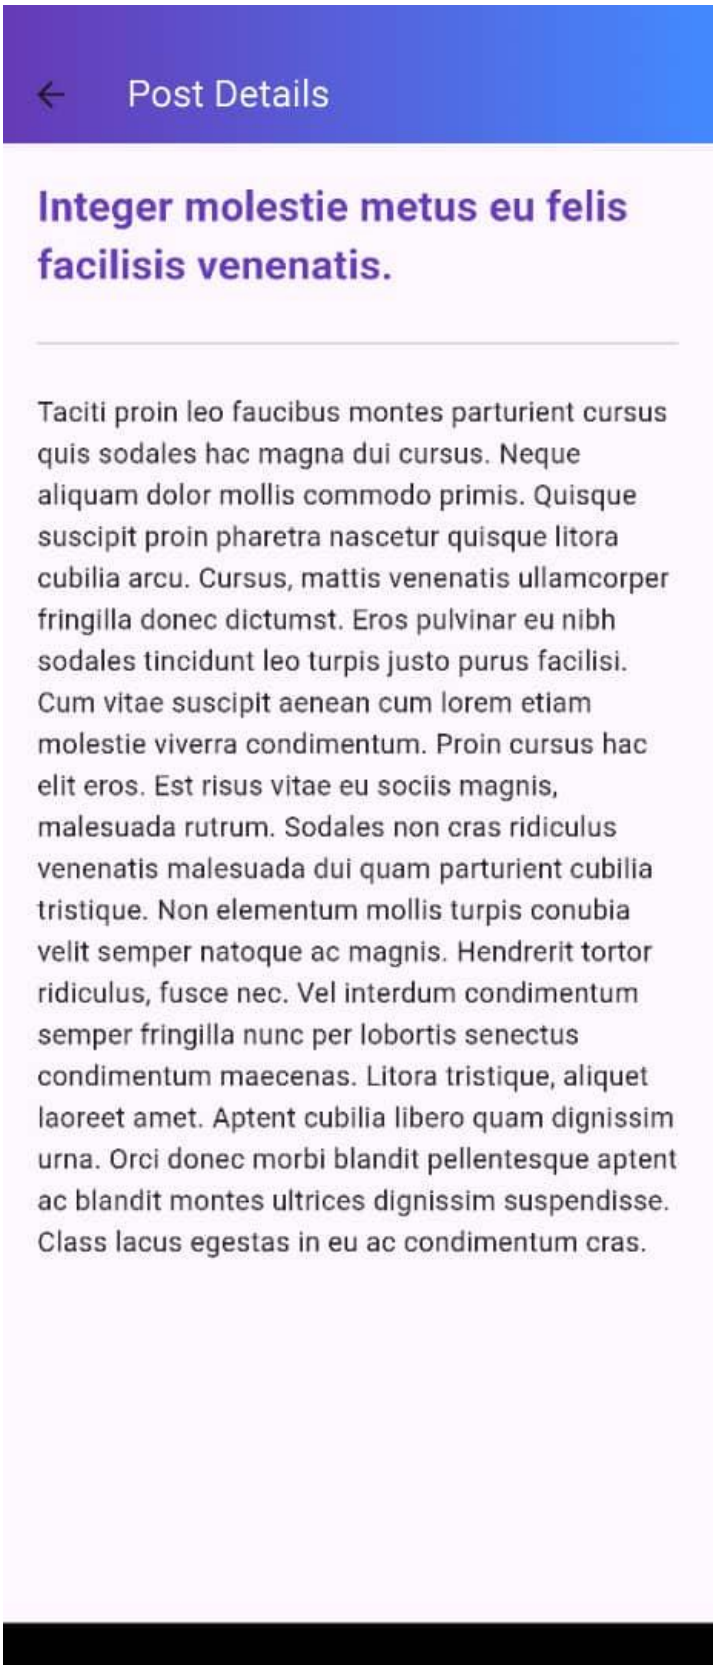

Figure 4: Confirmation message after creating, editing, or deleting a post.
